                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         under expression of the protein. The invention also relates to methods of identifying agonists and antagonists and for using such compounds to treat conditions associated with HNFDY20 imbalance. Diagnostic assays for detecting diseases associated with inappropriate HNFDY20 activity or levels are also provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1841 BP;

Mutant versions of this sequence encode proteins which cause retinal degeneration. These sequences may be identified using primers/ probes described in the invention (see also Q43545-48) and may be used to diagnose hereditary retinal degeneration. This sequence is the closest approximation to the gene sequence as the sequence given in the specification is not printed clearly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Probe or primer contg. sequence of human retinal degeneration slow protein mutant - used to diagnose hereditary retinal degenerative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence is a fragment of the Kaposi's sarcoma-associated herpesvirus (KSHV) LUR (long unique region). This fragment contains coding regions for ORF65 which encodes capsid protein IV, ORF66, ORF67 which encodes to rote in IV, ORF68 which encodes a glycoprotein, ORF69, K12 which encodes kaposin, K13, ORF72 which encodes cyclin D, ORF73 which encodes immediate early protein (IEP), K14 which encodes COX-2 (v-adh), ORF74 which encodes G-protein coupled receptor, ORF75 which encodes tegument protein/FGGRAT, K15, KSHV is a new human the Herpesvirus (HHV8) believed to cause Kaposi's sarcoma (KS) which is the most common form of neoplasm occurring in persons with acquired immune deficiency syndrome (AIDS). The DHFR protein is useful for vaccination, prophylaxis, diagnosis and treatment of a subject with Kaposi's sarcoma and for detecting expression of a DNA virus associated with Kaposi's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          24312

This sequence represents the long unique region and terminal repeat of the Kaposi's sarcoma-associated herpes virus (KSHY). KSHY is also known as human herpes virus 8 (HHY8). This sequence contains the DNAs of the cinvention which encode KSHV polypeptides selected from: (a) viral fire protein the protein (MIP) II; (b) viral interleukin-6 (II-6); (c) viral IRF 1; (d) complement-binding protein; glycoproteins B, M or I; (d) capsid protein IV encoded by ORF65; and (e) immediate early protein encoded by ORF73. Labelled probes for the nucleic acid, proteins encoded by it, and antibodies (Ab) specific for the proteins are useful for CC detecting HHV8, specifically proteins of Kaposi's sarcoma, in body fluids or tissue samples. HHV8 infections can be treated with antisense created valid and protein can be used in proteins or treated with antisense contain. Ab may be used for prophylaxis or treated with antisense containing the content of the protein can be used in protective vaccines. Ab may also be used the protein can be used in protective vaccines. Ab may also be used cother lymphoproliferative diseases such as lymphomas, leukaemia, containing the concleic acid are useful for drug screening. HHV8-derived peptides can be inhibited with methotrexate. These can also be used to determine the immune status of a batient infected with HTV. HHV8 derived containing the containing the containing the summan status of a batient infected with HTV. HHV8 derived rection and the many of the immune status of a batient infected with HTV. HHV8 derived rection in the containing the containing the containing the summan status of a batient infected with HTV.
  Sequence 137507 BP; 32579 A; 37795 C;
                                                  the immune status of a patient infected with HIV. HHV8 derived protein viral MIP III may be used as an anti-inflammatory agent for, e.g. treating rheumatoid arthritis. This sequence is stated as containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid encoding Kaposi's sarcoma associated herpes proteins - useful for, e.g. detecting levels of HHV8 in, and preparation of vaccines for treatment of, HIV patients

                                                                                                                                                                                                                                                               Sequences T79063-66 represent novel allelic genes of the Xenopus laevis melatonin receptor MEL-IA. The sequences encode proteins which are 65 amino acids shorter than those described in the prior art. Also the last 2 C-terminal amino acids encoded by these sequences are different from the previously known proteins. This sequence is a short form of the novel receptor MEL-IAa also known as Mel 1-c(alpha). As compared to the long form (T79063), the difference occurs in the 3' untranslated region (both sequences encode the same protein), which is thought to affect the half-life of the mRNA. The nucleotide sequence was isolated from CDNA derived from Xenopus skin RNA and amplified using the primers T79067-76. The nucleotide sequence was isolated from control inhibit adenylyl cyclase, but both protein MEL-IAA has been shown to inhibit adenylyl cyclase, but both proteins can modulate intracellular scape.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    T79064;

                                                                                                                                                                                                                                                                                                                Sequences T79063-66 represent novel allelic genes of the Xenopus laevis melatonin receptor MEL-1A. The sequences encode proteins which are 65 melatonin receptor MEL-1A. The sequences encode proteins which are 65 mino acids shorter than those described in the prior art. This sequence is a short form of the novel receptor MEL-1Ab also known as compared to the short form (T79066), the difference cocurs in the 3' untranslated region (both sequences encode the same protein), which is thought to affect the half-life of the mRNA. The protein), which is thought to affect the half-life of the mRNA. The correction, which is thought to affect the half-life of the mRNA. The correction acids. The nucleotide sequence was isolated from CDNA derived from Xenopus skin RNA and amplified using the primers T79067-76. The nucleotide sequence encodes a protein which is a 7 transmembrane receptor involved in cellular signalling. MEL-lab has been shown to modulate the inhibitor of phosphodiesterase, but unlike MEL-laa (T79063) cannot inhibitor of phosphodiesterase, but unlike MEL-laa (T79063) cannot
                                                                      Align seg 1/1 to: T79066
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding functional melatonin receptor of Xenopus for screening for potential (ant)agonists useful for e.g. treating cardiovascular disease and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Allele; Xenopus laevis; melatonin; receptor; untranslated region; PCR; mRNA; half-life; skin; amplification; primer; polymerase chain reaction; transmembrane domain; cellular signalling; inhibition; adenylyl cyclase; modulation; intracellular; cyclic GMP; inhibitor; phosphodiesterase; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           T79063
                                                                                                                                                                                                                                                                                                  melatonin receptor MEL-1A. The sequences encode proteins which are 65 amino acids shorter than those described in the prior art. Also the last 2 C-terminal amino acids encoded by these sequences are different from the previously known proteins. This sequence is a long form of the novel receptor MEL-1Aa also known as Mel 1-c(alpha). As compared to the short form (179064), the difference occurs in the 3' untranslated region (both sequences encode the same protein), which is thought to affect the sequences encode the same protein), which is thought to affect the half-life of the mRNA. The nucleotide sequence was isolated from cDNA derived from Xenopus skin RNA and amplified using the primers T79067-76. The nucleotide sequence encodes a protein which is a 7 transmembrane receptor involved in cellular signalling. MEL-1Aa has been shown to inhibit adenylyl cyclase, but both proteins can modulate intracellular newshorked in cellular signalling. MEL-1Aa has been shown to inhibit adenylyl cyclase, but both proteins can modulate intracellular newshorked interests.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         10-NOV-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding functional melatonin receptor of Xenopus for screening for potential (ant)agonists useful for e.g. treating cardiovascular disease and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 1997-132635/12

The sequences encode proteins which are 65 cc amino acids shorter than those described in the prior art. This sequence is a long form of the novel receptor MEL-1Ab also known as Mel 1-c(beta). CC As compared to the short form (T79066), the difference occurs in the 3' cc untranslated region (both sequences encode the same protein), which is CC thought to affect the half-life of the mRNA. The MEL-1Ab sequences also CC differ from known MEL-1A receptor sequences by 6 amino acids. The CC uncleotide sequence was isolated from cDNA derived from Xenopus skin RNA cand amplified using the primers T79067-76. The nucleotide sequence cc encodes a protein which is a 7 transmembrane receptor involved in CC cellular signalling. MEL-1Ab has been shown to modulate intracellular CC coMF, sep. inhibiting its accumulation induced by an inhibitor of CC compared to the compared to the modulate intracellular composition of the compared to the compared to the modulate intracellular composition according to the primers of the composition of the compared to the composition of the compositi

                                                                                                                                                                                                                                                                                                                                                                                                   pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protein search, using sw model

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, hematopolesis regulating activity, tissue growth activity, hemostatic and thrombolytic activity, chemotactic/chemokinetic activity, hemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumor invasion suppressor activity, and tumor invasion suppressor activity, and tumor inhibition activity. The PNs are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection or function of bacteria, fungi, viruses and other parasites; effecting bodily characteristics such as, e.g. weight, color, skin, etc., effecting bodily characteristics such as, e.g. weight, color, skin, etc., effecting browths or caricadic cycles; enhancing fertility, treatment of depression; treatment of pain; hormonal or endocrine activity.
                 hereditary.

                                                                               11-NOV-1993
                                                                                                                               R38483 standard; Protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the mmino acid sequence of the pt127_1 protein, which is derived from the pt127_1 clone isolated from a human adult blood (lymphoblastic leukemia MOLT-4) cDNA library.

The PNS and proteins of the invention are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional

```

```
The sequence given represents the human rhodopsin protein. Mutant rhodopsin proteins cause retinal degeneration. The DNA encoding the mutant DNA sequences may be identified using primers/probes described in the invention (see also 043545-48) and may be used to diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Probe or primer contg. sequence of human retinal degeneration slow protein mutant - used to diagnose hereditary retinal degenerative diseases

Substitution of histidine for the normal nonpolar amino acid proline at position 23 results in a dysfunctional or absent molecule, affecting rod function, and is linked with autosomal dominant retinitis pigmentosa. Probes and primers specific for this mutation may be used as diagnostic agents. Mutations in the campendate pigmentosa. Detection slow protein and retinal rod cGMP-phosphodiesterase genes are also implicated in retinitis pigmentosa. Detection of any of these mutations in a foetus or patient may be used in diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Diagnosis of hereditary retinal degenerative diseases e.g. retinitis pigmentosa, - caused by a human photoreceptor protein mutation, by detection of the mutation by PCR amplification or hybridisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; rhodopsin; transversion; mutation; retinitis pigmentosa; probe; primer; hybridisation; polymerase chain reaction; PCR; eye; rod; retina; diagnostic; prenatal diagnosis; photoreceptor.

                                                                                                                                                                                                                                            proteins selected from cAMP, adenosine, muscarinic acetylcholine, proteins selected from cAMP, adenosine, muscarinic acetylcholine, addrenergic, thrombin, endothelin, bombesin, endocrine, rhodopsin, opsin, odorant, cytomegaloviral and other G-protein coupled receptors. The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see R48759-R48758, R50569-R50807 and R89189-R89195 for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                G-protein coupled receptor; ligand binding as psychotic disorder; schizophrenia; dopamine; muscarinic acetylcholine; adrenergic; endothe

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                              Proteins W02657-W02730 represent a range of G-protein coupled receptor (GPR) proteins selected from CAMP, adenosine, muscarinic acetylcholine, adrenergic, thrombin, endocthelin, bombesin, endocrine, rhodopsin, opsin, odorant, cytomegaloviral and other GPR proteins. The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see W02747-W0299) for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology chickers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        schizophrenia; dopamine; cAMP;

This polypeptide comprises HNFDY20, a novel human 7-transmembr G-protein coupled receptor that shows about 30.8% identity in amino acid residues with the thrombin receptor. Its amino aci sequence was deduced from an isolated HNFDY20 polypucleotide sequence (see V53631). The invention relates to HNFDY20 polypeptides and recombinant materials and methods for their
                                                                                                                                              New polynucleotides and polypeptides encoding a novel human 7-transmembrane receptor - useful for diagnosing and treations cancer, osteoporosis and Parkinson's disease and infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                             HNFDY20; G-protein coupled receptor; human; infection; HIV; pain; cancer; anorexia; asthma; Parkinson's disease; acute heart failur hypotension; hypertension; urinary retention; osteoporosis; angina pectoris; myocardial infarction; ulcer; allergy; benign prostatic hypertrophy; psychosis; anxiety; schizophrenia; manic depression; delirium; dementia; mental retardation; dyskinesia; Huntingdon's disease; Gilles de la Tourette's syndron

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             production. It also provides methods for using such polypeptides and HNFDY20 polynucleotides for treatment of infections such as bacterial, fungal, protozoan and particularly HIV-1 or HIV-2 infections, and conditions including pain, cancers, anorexia, asthma, parkinson's disease, acute heart failure, hypotension, arkinary retention, osteoporosis, angina pectoris, hypertrophy, and psychotic and neurological disorders, including the hypertrophy, and psychotic and neurological disorders, including anxiety, schizophrenia, manic depression, delirium, dementia, severe mental retardation and dyskinesias, such as Huntingdon's disease or Gilles de la Tourette's syndrome. Gene therapy using RNA encoding HNFDY20 can be used to treat conditions caused by under-expression of the protein. The invention also relates to methods of identifying agonists and antagonists and for using such compounds to treat conditions associated with HNFDY20 imbalance. Diagnostic assays for detecting diseases associated with inappropriate HNFDY20 activity or levels are also provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ğ

                                                                                                                                                                                                                                     Sequences W25926-7 represent novel allelic xenopus laevis melatonin receptor MEL-1A proteins. This sequence is a new form of the melatonin receptor designated MEL-1Aa, also known as Mel 1 -c(alpha). The protein differs from previously known receptors by being 65 amino acids shorter and also having 2 different C-terminal amino acids. The protein is encoded by 2 different alleles (T79063-4) which differ in the 3' untranslated region (both sequences encode the same protein), which is thought to affect the half-life of the mRNA. The coding sequence was isolated from cDNA derived from Xenopus skin RNA and amplified using the primers T79067-76. The nucleotide sequence encodes a 7 transmembrane receptor involved in cellular signaling. MEL-1Aa has been shown to CGMP, esp. inhibiting its accumulation induced by an inhibitor of phosphodiesterase.
                                                                                                                                                                                                                               cGMP, esp. inhibit phosphodiesterase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   receptor designated MEL-IAb, also known as Mel I-c(beta). The protein differs from previously known receptors by being 65 amino acids shorter and also differs throughout the sequence by 6 amino acids. The protein is encoded by 2 different alleles (T79065-6) which differ in the 3' untranslated region (both sequences encode the same protein), which is thought to affect the half-life of the mRNA. The coding sequence was isolated from cDNA derived from Xenopus skin RNA and amplified using the primers T79067-76. The nucleotide sequence encodes a 7 transmembrane receptor involved in cellular signalling. MEL-IAb has been shown to modulate intracellular cGMP, esp. inhibiting its accumulation induced by an inhibitor of phosphodiesterase, but unlike the MEL-IAb protein, it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequences W25926-7 represent novel allelic receptor MEL-1A proteins. This sequence is receptor designated MEL-1Ab, also known as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid encoding functional melatonin receptor of Xenopus for screening for potential (ant)agonists useful for e.g. treating cardiovascular disease and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

Phosphorylation sites in the encoding bnA may be used for isolation of sheep, mouse and human receptor sequences. Receptor fragments which interact with melatonin, or specific antibodies; may be used as receptor-agonists or receptor-antagonists. Agonists may be used in therapy of circadian rhythm disorders such as jet-lag or day-night cycle disorders, to control ovulation, or in alteration of reproductive cycles in seasonally breeding animals. Antagonists may be used to control the initiation or timing of puberty in humans. The receptor gene may also be expressed in a transgenic animal for use as a model system to screen agonists and antagonists.

Rat pheromone receptors VNI, VN3, VN4, VN5, VN6, VN7 and VN2 (M19103-09) are members of a novel family of presumed 7-transmembrane domain receptors that are evolutionary independent of the odorant receptors of the main olfactory epithelium (MOE). Their amino acid sequences were deduced from cDNA clones (see also T69545-50, VN2 sequence not provided) obtd. by differential cloning, PCR and hybridisation from single vomeronasal sensory neurons (VSN). Individual neurons express different complements of the receptors. VN polypeptides can be expressed in host-vector systems for use in identifying modulators for control of maternal, reproductive and social behavior, to increase fertility, control permane against and to receive the receptors.
                                                                                                                                                                   Nucleic acid molecule encoding vertebrate pheromone receptor -useful to identify modulators for control of reproductive and social behaviour, fertility and hormone secretion

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 망
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence from human GLUT-1 (see W17835) operatively linked to a contiguous amino acid sequence from rat GLUT-2. The GLUT-1/GLUT-2 chimeric transporter confers glucose sensing capacity to a cell without rendering the cell subject to diabetta immune destruction. C and does not transport streptozotocin. The chimeric transporter comay be expressed in vivo by administration of a claimed chimeric polynucleotide (see T66495-96) for treatment of diabetes, or expressed in a host cell to prepare a recombinant cell that secretes insulin in response to glucose and which can be administered to a patient to treat diabetes. GLUT-2 can also be and on claimed methods of cell killing, such as negative selection cand double seletion protocols in vitro, in screening methods for cidentifying genes, promoters and substrates, and in cell killing in vivo, such as may be used in cancer treatment.

```
The cDNA sequences are obtained from cDNA libraries, prepared from CC fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina. CC The encoded polypeptides have specific uses based on their homology to CC associated with the preservation and maintenance of gastrointestinal CC mucosa and the repair of acute and chronic mucosal lesions (e.g. enterocolitis, Zollinger-Ellison syndrome, gastrointestinal CC ulceration and congenital microvillus atrophy), skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis, epithelial CC cancers such as lung squamous cell carcinoma of the vulva and gliomas), CC potent effects on cell growth and development, diseases related to growth cor survival of nerve cells including Parkinson's disease, Alzheimer's CC disease, ALS, neuropathies or cancer pro265 can be used as for CC fibromodulin, e.g. for reducing dermal scarring. PRO264 can be used as a target for anti-tumor drugs. PRO253 may be used in the treatment CC of Usher Syndrome or Atrophia areata; pRO269 can be used as an anti-tumor drugs. PRO269 can be used as an anti-tumor drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            29-OCT-1997;
